

January 7, 1974

Mr. Max Bell
Permanent Salary and Sabbatical Leave Committee
Mt. San Antonio College

Dear Mr. Bell:

In response to your request for further information about my sabbatical project for the '72-'73 school year, I am enclosing a copy of the sketches I have done for the 120 illustrations to be included in the preliminary copy of the book, Physics for Inhalation Therapy Students, which constituted my project. A bibliography of part of the references used is also enclosed; periodicals, U. S. Government publications, encyclopedia, and company publications are not included. Basic physics texts seldom contain complete bibliographies; if there is a real need for a complete listing, I can compile one from my working notes.

A copy of my sabbatical request plan should be available to you in the President's Office. The course at Harvey Mudd College was not part of the original request--I mentioned it only as an example of the advantage of time flexibility during a sabbatical and because the course work I did related to the book I was working on. The course required four full school days of attendance, which would not have been possible for me during a normal school year. During the course on mathematical models, I worked out a fluid flow model for use in our physics lab programmable computer. The results can be used to demonstrate for inhalation therapy students how changing different variables affects fluid flow. The course was sponsored by the National Science Foundation which furnished certificates to the participants, but the course was not graded.

My library research was conducted chiefly in the Mt. San Antonio College and California State Polytechnic University libraries.

At the present time, I am going over my book with some former students who are working in the inhalation therapy field and who are preparing to take the registry examinations in that field in March. Since I designed

the book specifically to cover the topics which form the physics background in this field, I hope to make use of any suggestions of the therapists to improve the book and hope they will benefit from using it.

Next fall I plan to use material from the revised version in teaching the inhalation therapy physics courses and to try out problem sets and chapter review sections to be included. Altogether I will probably be working another year on revisions.

I hope the final result will be a useful text covering the physics background needed for inhalation therapy in a manner which is not available in other texts. This year I am not teaching the inhalation therapy physics course as originally planned, so I have not had an opportunity to use the special topics contained in Chapters 6 through 9; however, other parts of the material are useful in the courses which I am teaching (general physics and an allied health physics course for radiological technicians).

Sincerely,

Mavis L. McCormic
